Experiment # 5

Link list-Basic Deletion at desired positionl

Objective

The objective of this session is to insertion, traversal and deletion at desired position in link list using C++.

Software Tool

1. I use Code Blocks with GCC compiler.

1 Theory

This section discusses how to insert an item into, and delete an item from, a linked list. Consider the following definition of a node. (For simplicity, we assume that the info type is int. struct nodeType { int info; nodeType* link; }; We will use the following variable nodeType *head, *p, *q, *newNode; INSERTION:- Algorithms which insert nodes into the linked list come up in various situations. We discuss three of them here. The first one inserts a node at the beginning of the list, the second one inserts a node after a node with a given location, and the third one inserts a node into the sorted list.

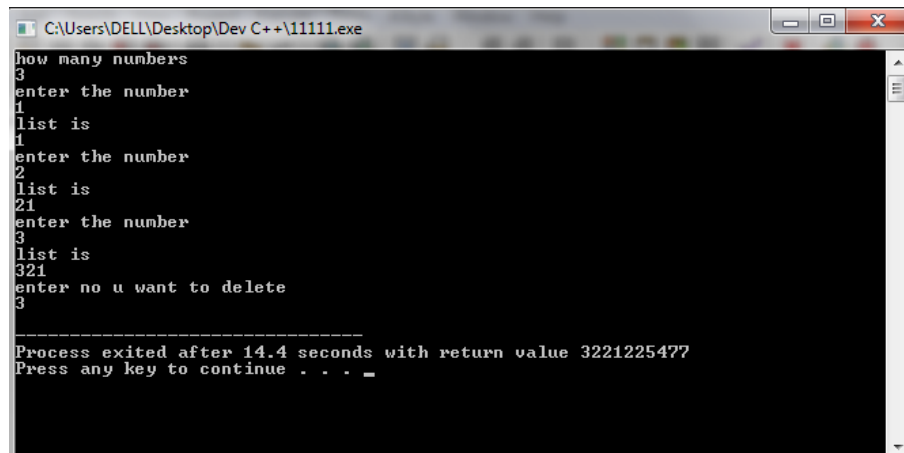

2 Task

2.1 Procedure: Task 5

Write a C++ code using functions for the following operations. 1.Creating a linked List. 2.Traversing a Linked List. 3.Inserting the node at the start of the list. 4.Inserting a node after a given node. 5.Inserting a node in a sorted list.

2.2

```
#include<iostream>
```

```
C:\Users\DELL\Desktop\Dev C++\11111.exe
how many numbers
3
enter the number
1
list is
1
enter the number
2
list is
21
enter the number
3
list is
321
enter no u want to delete
3

-----
Process exited after 14.4 seconds with return value 3221225477
Press any key to continue . . . _
```

Figure 1: output

```
#include<stdlib.h>
using namespace std;
struct Node{
    int data;
    struct Node*next;
};
struct Node*head;
void insert(int x){
    struct Node*temp=(Node*) malloc (sizeof (struct Node));
    temp->data=x;
    temp->next=head;
    head=temp;
}
void print ()
{
    struct Node*temp=head;
    cout<<" list _is"<<endl;
    while (temp!=NULL)
    {
        cout<<temp->data;
        temp=temp->next;
    }
}
```

```

        cout<<endl;
    }
    void Delete(int n){
        int temp;
        struct Node* temp1= head;
        if (n==1){
            head=temp1->next;
            free (temp1);
            return;
        }
        int i;
        for ( i=0;i<n-1;i++){
            temp1=temp1->next;
            struct Node* temp2=temp1->next;

            temp1->next=temp2->next;
            free (temp2);
        }
    }
int main(){
    head=NULL;
    cout<<"how many numbers"<<endl;
    int n,i,x,y;
    cin>>n;
    for ( i=0;i<n;i++){
        cout<<"enter the number"<<endl;
        cin>>x;
        insert(x);
        print ();
    }
    cout<<"enter no u want to delete"<<endl;
    cin>>y;
    Delete(y);
    print ();
}

```

3 Conclusion

In today lab we have discussed how we can create a link list and display it on a screen and also discuss a third function of delete with which we can

delete the node .
